**Objective**

**Question:**

Does the following anticipating stochastic evolution equation (see):

\[
\frac{dv(t)}{dt} = Av(t) dt + F_0 v(t) dt + Bv(t) dW(t); \quad t > 0;
\]

\(v(0) = Y\)

admit a solution with a random initial condition \(Y\):  

\(H\) in a Hilbert space \(H\)?

**Answer:**

YES! (provided \(Y\) is sufficiently regular).
Question:

Does the following anticipating stochastic evolution equation (see):

\[
\begin{align*}
dv(t) &= -Av(t)\,dt + F_0(v(t))\,dt \\
&\quad + Bv(t) \circ dW(t), \quad t > 0, \\
v(0) &= Y
\end{align*}
\]

admit a solution with a random initial condition \( Y : \Omega \to H \) in a Hilbert space \( H \)?

Answer: YES! (provided \( Y \) is sufficiently regular.)
Question: Does the following anticipating stochastic evolution equation (see):

\[ dv(t) = -Av(t) \, dt + F_0(v(t)) \, dt + Bv(t) \circ dW(t), \quad t > 0, \]

\[ v(0) = Y \]

admit a solution with a random initial condition \( Y : \Omega \rightarrow H \) in a Hilbert space \( H \)?

Answer: YES! (provided \( Y \) is sufficiently regular).
Question:
Does the following anticipating stochastic evolution equation (see):

\[ dv(t) = -Av(t) \, dt + F_0(v(t)) \, dt + Bv(t) \circ dW(t), \quad t > 0, \]

\[ v(0) = Y \]

admit a solution with a random initial condition \( Y : \Omega \rightarrow H \) in a Hilbert space \( H \)?

Answer:
YES! (provided \( Y \) is sufficiently regular).
Strategy

- Replace $Y$ in see (1) by a deterministic initial condition $x$ in $H$ and get the corresponding (equivalent) Itô see:

\[
\begin{aligned}
du(t, x) &= -Au(t, x) \, dt + F(u(t, x)) \, dt \\
&\quad + Bu(t, x) \, dW(t), \quad t > 0 \\
\end{aligned}
\]

\[u(0, x) = x \in H\]  \hspace{1cm} (2)

with $F$ a suitably modified non-linear drift.
Strategy

- Replace $Y$ in see (1) by a deterministic initial condition $x$ in $H$ and get the corresponding (equivalent) Itô see:

\[
du(t, x) = -Au(t, x) \, dt + F(u(t, x)) \, dt + Bu(t, x) \, dW(t), \quad t > 0
\]

\[
u(0, x) = x \in H
\]

with $F$ a suitably modified non-linear drift.

- View the solution of the see (2) as a function (cocycle) $U(t, x, \omega)$ of three variables $(t, x, \omega)$ with Fréchet and Malliavin regularity in $x$ and $\omega$ (resp.)
Consider the Stratonovich version of the Itô see (2):

\[ du(t, x) = -Au(t, x) \, dt + F_0(u(t, x)) \, dt + Bu(t, x) \circ dW(t), \quad t > 0 \]

\[ u(0, x) = x \in H \]

\[ (2') \]
Consider the Stratonovich version of the Itô see (2):

\[ du(t, x) = -Au(t, x) \, dt + F_0(u(t, x)) \, dt \]
\[ + Bu(t, x) \circ dW(t), \quad t > 0 \]
\[ u(0, x) = x \in H \]

(2')

In the above semilinear see, is it justified to replace the deterministic initial condition \( x \) by an arbitrary random variable \( Y \) (substitution theorem)?
If **YES**, then get back the anticipating Stratonovich see (1) again:

\[
\begin{align*}
\frac{dU(t,Y)}{dt} &= -AU(t,Y)dt + F_0(U(t,Y))dt \\
&\quad + BU(t,Y) \circ dW(t), \quad t > 0
\end{align*}
\]

\[U(0,Y) = Y\]

by taking \(v(t) := U(t,Y), \quad t \geq 0.\)
Affirmative answer for the above question is known for a wide class of finite-dimensional sde’s via substitution theorems ([Nu.1-2], [M-S.2]).
Affirmative answer for the above question is known for a wide class of finite-dimensional SDE’s via substitution theorems ([Nu.1-2], [M-S.2]).

Known substitution theorems require a level of regularity of the cocycle $U(t, x, \omega)$ in $t$ that is inconsistent with infinite-dimensionality of the stochastic dynamics (Cf. Theorem 3.2.6 [Nu.1], Theorem 5.3.4 [Nu.2]).
Difficulties

- Affirmative answer for the above question is known for a wide class of finite-dimensional sde’s via substitution theorems ([Nu.1-2], [M-S.2]).

- Known substitution theorems require a level of regularity of the cocycle $U(t, x, \omega)$ in $t$ that is inconsistent with infinite-dimensionality of the stochastic dynamics (Cf. Theorem 3.2.6 [Nu.1], Theorem 5.3.4 [Nu.2]).

- Existing substitution theorems work under restrictive finite-dimensional or compactness constraints ([G-Nu-M]).
Difficulties-Contd

- Failure of Kolmogorov’s continuity theorem in infinite dimensions ([Mo.1], [Sk]).
Difficulties-Contd

- Failure of Kolmogorov’s continuity theorem in infinite dimensions ([Mo.1], [Sk]).
- Failure of Sobolev inequalities in infinite dimensions.
Approach

- Construct Fréchet differentiable stochastic semiflow for the semilinear Itô see (2) using a chaos-type expansion technique ([M-Z-Z]).
Approach

- Construct Fréchet differentiable stochastic semiflow for the semilinear Itô see (2) using a chaos-type expansion technique ([M-Z-Z]).

- Use ideas and techniques of the Malliavin calculus: Assume Malliavin regularity of the initial condition -rather than imposing finite-dimensional or compactness restrictions on the values of the initial random condition.
**Approach**

- Construct Fréchet differentiable stochastic semiflow for the semilinear Itô see (2) using a chaos-type expansion technique ([M-Z-Z]).

- Use ideas and techniques of the Malliavin calculus: Assume **Malliavin regularity** of the initial condition - rather than imposing finite-dimensional or compactness restrictions on the values of the initial random condition.

- Develop global spatial estimates on the semiflow, its Malliavin and Fréchet derivatives.
Approach

- Construct Fréchet differentiable stochastic semiflow for the semilinear Itô see (2) using a chaos-type expansion technique ([M-Z-Z]).

- Use ideas and techniques of the Malliavin calculus: Assume Malliavin regularity of the initial condition -rather than imposing finite-dimensional or compactness restrictions on the values of the initial random condition.

- Develop global spatial estimates on the semiflow, its Malliavin and Fréchet derivatives.

- Use of Malliavin calculus techniques is necessary because the initial condition and the underlying stochastic dynamics are infinite-dimensional.
Motivation

Substitution theorem provides a dynamic characterization of stable/unstable manifolds for semilinear see’s near hyperbolic stationary states.
Motivation

Substitution theorem provides a dynamic characterization of stable/unstable manifolds for semilinear see’s near hyperbolic stationary states.

Expect techniques developed in this analysis to yield similar substitution theorems for semiflows induced by sfde’s.

Set-up: Brownian Motion

- $W := E$-valued Brownian motion $W : \mathbb{R} \times \Omega \to E$ with separable covariance Hilbert space $K \subset E$, Hilbert-Schmidt embedding.
Set-up: Brownian Motion

- \( W := E\)-valued Brownian motion \( W : \mathbb{R} \times \Omega \to E \) with separable covariance Hilbert space \( K \subset E \), Hilbert-Schmidt embedding.

- \( W(t) = \sum_{k=1}^{\infty} W^k(t) f_k, \quad t \in \mathbb{R}; \)

- \( \{f_k : k \geq 1\} := \) complete orthonormal basis of \( K \);
- \( W^k, k \geq 1, \) standard independent one-dimensional Wiener processes ([D-Z.1], Chapter 4).
Set-up: Brownian Motion

- \( W := E \)-valued Brownian motion \( W : \mathbb{R} \times \Omega \rightarrow E \) with separable covariance Hilbert space \( K \subset E \), Hilbert-Schmidt embedding.

\[
W(t) = \sum_{k=1}^{\infty} W^k(t) f_k, \quad t \in \mathbb{R};
\]

\( \{f_k : k \geq 1\} := \text{complete orthonormal basis of } K; \)

\( W^k, k \geq 1, \text{ standard independent one-dimensional Wiener processes } ([D-Z.1], \text{Chapter 4}). \) Series converges absolutely in \( E \) but not necessarily in \( K \).
Set-up: Brownian Motion

- \( W := E\)-valued **Brownian motion** \( W : \mathbb{R} \times \Omega \rightarrow E \) with separable **covariance Hilbert space** \( K \subset E \), Hilbert-Schmidt embedding.

- \( W(t) = \sum_{k=1}^{\infty} W^k(t) f_k, \quad t \in \mathbb{R}; \)

\[ \{ f_k : k \geq 1 \} := \text{complete orthonormal basis of } K; \]

\( W^k, k \geq 1, \) standard independent **one-dimensional Wiener processes** ([D-Z.1], Chapter 4). Series converges absolutely in \( E \) but not necessarily in \( K \).

- (\( W, \theta \)) is a **helix**:

\[ W(t_1 + t_2, \omega) - W(t_1, \omega) = W(t_2, \theta(t_1, \omega)) \]
Set-up-contd

- \( L_2(K, H) := \text{Hilbert space} \) of all Hilbert-Schmidt operators \( S : K \rightarrow H \), with norm

\[
\|S\|_2 := \left[ \sum_{k=1}^{\infty} |S(f_k)|_H^2 \right]^{1/2}
\]
Set-up-contd

- $L_2(K, H) := \text{Hilbert space}$ of all Hilbert-Schmidt operators $S : K \to H$, with norm

$$\|S\|_2 := \left[ \sum_{k=1}^{\infty} |S(f_k)|_H^2 \right]^{1/2}$$

- $F_0 : H \to H$ is $C^1_b$. 
Set-up-contd

- $L_2(K, H) := \text{Hilbert space}$ of all Hilbert-Schmidt operators $S : K \rightarrow H$, with norm

$$\|S\|_2 := \left[ \sum_{k=1}^{\infty} |S(f_k)|^2_H \right]^{1/2}$$

- $F_0 : H \rightarrow H$ is $C^1_b$.

- $F := F_0 + \frac{1}{2} \sum_{k=1}^{\infty} B_k^2$, where $B_k \in L(H)$ are given by

$$B_k(x) := B(x)(f_k), \ x \in H, \ k \geq 1; \ \text{and} \ \sum_{k=1}^{\infty} \|B_k\|^2$$

converges.
Set-up: The Semilinear SEE

Consider the semilinear Itô stochastic evolution equation (see):

\[
du(t, x) = -Au(t, x) \, dt + F(u(t, x)) \, dt
\]
\[
+ Bu(t, x) \, dW(t), \quad t > 0
\]
\[
u(0, x) = x \in H
\]

in \( H \).
Consider the semilinear Itô stochastic evolution equation (see):

\[
du(t, x) = -Au(t, x) \, dt + F(u(t, x)) \, dt + Bu(t, x) \, dW(t), \quad t > 0
\]

\[
u(0, x) = x \in H
\]

in \( H \).

\( A : D(A) \subset H \rightarrow H \) is a closed linear operator on \( H \).
Set-up: The Semilinear SEE

Consider the semilinear Itô stochastic evolution equation (see):

\[ \begin{align*}
    du(t, x) &= -Au(t, x) \, dt + F(u(t, x)) \, dt \\
    &\quad + Bu(t, x) \, dW(t), \quad t > 0 \\
    u(0, x) &= x \in H
\end{align*} \] (2)

in \( H \).

\( A: D(A) \subset H \to H \) is a closed linear operator on \( H \).

Assume \( A \) has a complete orthonormal system of eigenvectors \( \{e_n : n \geq 1\} \) with corresponding positive eigenvalues \( \{\mu_n, n \geq 1\} \); i.e., \( Ae_n = \mu_n e_n, \quad n \geq 1 \).
Suppose $-A$ generates a strongly continuous semigroup of bounded linear operators $T_t : H \to H$, $t \geq 0$. 

[74x80]The Set-up-contd

Anticipating Semilinear SPDEs
Suppose $-A$ generates a strongly continuous semigroup of bounded linear operators $T_t : H \to H$, $t \geq 0$.

$F : H \to H$ is (Fréchet) $C^1_b$: $F$ has a globally bounded Fréchet derivative $F : H \to L(H)$. 
Suppose $-A$ generates a strongly continuous semigroup of bounded linear operators $T_t : H \to H$, $t \geq 0$.

$F : H \to H$ is (Fréchet) $C^1_b$: $F$ has a globally bounded Fréchet derivative $F : H \to L(H)$.

Suppose $B : H \to L_2(K, H)$ is a bounded linear operator. The Itô integral in the sense (2) is defined in the following sense ([D-Z.1], Chapter 4):
Set-up: The Itô Integral

Let $\psi : [0, a] \times \Omega \to L_2(K, H)$ be jointly measurable, $(F_t)_{t \geq 0}$-adapted and

$$
\int_0^a E\|\psi(t)\|_{L_2(K,H)}^2 dt < \infty.
$$
Set-up: The Itô Integral

Let $\psi : [0, a] \times \Omega \to L_2(K, H)$ be jointly measurable, $(\mathcal{F}_t)_{t \geq 0}$-adapted and

$$\int_0^a E\|\psi(t)\|_{L_2(K,H)}^2\, dt < \infty.$$ 

Set

$$\int_0^a \psi(t)\, dW(t) := \sum_{k=1}^{\infty} \int_0^a \psi(t)(f_k)\, dW^k(t)$$

where the $H$-valued Itô integrals on the right hand side are with respect to the one-dimensional Wiener processes $W^k$, $k \geq 1$. 

Anticipating Semilinear SPDEs
Series converges in $L^2(\Omega, H)$ because

$$
\sum_{k=1}^{\infty} E \left| \int_0^a \psi(t)(f_k) \, dW^k(t) \right|^2 = \int_0^a E \left\| \psi(t) \right\|_{L^2(K,H)}^2 dt < \infty.
$$
Standing Hypotheses

- **Hypothesis (A₁):** \( \sum_{n=1}^{\infty} \mu_n^{-1} \|B(e_n)\|_{L_2(K,H)}^2 < \infty \).
Standing Hypotheses

- **Hypothesis \((A_1)\):**
  \[
  \sum_{n=1}^{\infty} \mu_n^{-1} \| B(e_n) \|_{L_2(K,H)}^2 < \infty.
  \]

- **Hypothesis \((B)\):**
  \[B : H \rightarrow L_2(K, H)\] extends to a bounded linear operator \(B \in L(H, L(E, H))\);
  \[
  \sum_{k=1}^{\infty} \| B_k \|^2 < \infty, \text{ where } B_k \in L(H) \text{ is defined by}
  \]
  \[B_k(x) := B(x)(f_k), x \in H, k \geq 1.\]
Remarks

- Hypothesis \((A_1)\) is implied by the following two requirements:

  (a) The operator \(B: H^! \rightarrow L^2(K;H)\) is Hilbert-Schmidt.

  (b) \(\liminf_{n \to 1} n^{-1} > 0\).

Requirement (b) above is satisfied if \(A = \Delta\), where \(\Delta\) is the Laplacian on a compact smooth \(d\)-dimensional Riemannian manifold \(M\) with boundary, under Dirichlet boundary conditions. No restriction on \(\dim M\) under \((A_1)\) for SPDEs.
Remarks

- Hypothesis \((A_1)\) is implied by the following two requirements:
  
  (a) The operator \(B : H \rightarrow L_2(K, H)\) is Hilbert-Schmidt.
Hypothesis \((A_1)\) is implied by the following two requirements:

(a) The operator \(B : H \to L_2(K, H)\) is Hilbert-Schmidt.

(b) \(\lim_{n \to \infty} \inf \mu_n > 0\).
Remarks

- Hypothesis \((A_1)\) is implied by the following two requirements:
  
  - (a) The operator \(B : H \rightarrow L_2(K, H)\) is Hilbert-Schmidt.
  
  - (b) \(\liminf_{n \rightarrow \infty} \mu_n > 0\).

- Requirement (b) above is satisfied if \(A = -\Delta\), where \(\Delta\) is the Laplacian on a compact smooth \(d\)-dimensional Riemannian manifold \(M\) with boundary, under Dirichlet boundary conditions.
Hypothesis \((A_1)\) is implied by the following two requirements:

(a) The operator \(B : H \rightarrow L_2(K, H)\) is Hilbert-Schmidt.

(b) \(\lim \inf_{n \to \infty} \mu_n > 0\).

Requirement (b) above is satisfied if \(A = -\Delta\), where \(\Delta\) is the Laplacian on a compact smooth \(d\)-dimensional Riemannian manifold \(M\) with boundary, under Dirichlet boundary conditions.

No restriction on \(\text{dim} M\) under \((A_1)\) for spdes.
A mild solution of the semilinear see (2) is a family of $(\mathcal{B}(\mathbb{R}^+) \otimes \mathcal{F}, \mathcal{B}(H))$-measurable, $(\mathcal{F}_t)_{t \geq 0}$-adapted processes $u(\cdot, x, \cdot) : \mathbb{R}^+ \times \Omega \to H$, $x \in H$, satisfying the following stochastic integral equation:

$$u(t, x, \cdot) = T_t x + \int_0^t T_{t-s} F(u(s, x, \cdot)) \, ds$$

$$+ \int_0^t T_{t-s} B u(s, x, \cdot) \, dW(s), \quad t \geq 0,$$

([D-Z.1-2]).
The Itô see (2) has the equivalent Stratonovich form

\[ du(t, x) = -Au(t, x) \, dt + F(u(t, x)) \, dt \]

\[ -\frac{1}{2} \sum_{k=1}^{\infty} B_k^2 u(t, x) \, dt + B u(t, x) \circ dW(t) \]

\[ u(0, x) = x \in H \]

where \( B_k \in L(H) \) are given by \( B_k(x) := B(x)(f_k) \), \( x \in H, \ k \geq 1 \).
\( k = \text{non-negative integer}. \ H \text{ real Hilbert.} \)
The Cocycle

\( k = \) non-negative integer. \( H \) real Hilbert.

A \( C^k \) perfect cocycle \((U, \theta)\) on \( H \) is a measurable random field \( U : \mathbb{R}^+ \times H \times \Omega \rightarrow H \) such that:

1. For each \( \omega \in \Omega \), the map \( U(t;x;\omega) \) is continuous in \((t;x) \in \mathbb{R}^+ \times H\)
2. For fixed \((t;\omega) \in \mathbb{R}^+ \times \Omega\), \( U(t;x;\omega) \) is \( C^k \) in \( x \in H \).
3. \( U(t_1 + t_2; x; \omega) = U(t_2; U(t_1; x; \omega), \omega) \) for all \( t_1, t_2 \in \mathbb{R}^+ \), all \( \omega \in \Omega \).
4. \( U(0;x;\omega) = x \) for all \( x \in H; \omega \in \Omega \).
The Cocycle

\( k = \) non-negative integer. \( H \) real Hilbert.

A \( C^k \) perfect cocycle \((U, \theta)\) on \( H \) is a measurable random field \( U : \mathbb{R}^+ \times H \times \Omega \to H \) such that:

- For each \( \omega \in \Omega \), the map \( U(t, x, \omega) \) is continuous in \( (t, x) \in \mathbb{R}^+ \times H \); for fixed \((t, \omega) \in \mathbb{R}^+ \times \Omega\), \( U(t, x, \omega) \) is \( C^k \) in \( x \in H \).
The Cocycle

$k = \text{non-negative integer. } H \text{ real Hilbert.}$

A $C^k$ perfect cocycle $(U, \theta)$ on $H$ is a measurable random field $U : \mathbb{R}^+ \times H \times \Omega \to H$ such that:

- For each $\omega \in \Omega$, the map $U(t, x, \omega)$ is continuous in $(t, x) \in \mathbb{R}^+ \times H$; for fixed $(t, \omega) \in \mathbb{R}^+ \times \Omega$, $U(t, x, \omega)$ is $C^k$ in $x \in H$.

- $U(t_1 + t_2, \cdot, \omega) = U(t_2, \cdot, \theta(t_1, \omega)) \circ U(t_1, \cdot, \omega)$ for all $t_1, t_2 \in \mathbb{R}^+$, all $\omega \in \Omega$. 

Anticipating Semilinear SPDEs – p.22/72
The Cocycle

\( k = \) non-negative integer. \( H \) real Hilbert.

A \( C^k \) perfect cocycle \((U, \theta)\) on \( H \) is a measurable random field \( U : \mathbb{R}^+ \times H \times \Omega \rightarrow H \) such that:

- For each \( \omega \in \Omega \), the map \( U(t, x, \omega) \) is continuous in \((t, x) \in \mathbb{R}^+ \times H\); for fixed \((t, \omega) \in \mathbb{R}^+ \times \Omega\), \( U(t, x, \omega) \) is \( C^k \) in \( x \in H \).

- \( U(t_1 + t_2, \cdot, \omega) = U(t_2, \cdot, \theta(t_1, \omega)) \circ U(t_1, \cdot, \omega) \) for all \( t_1, t_2 \in \mathbb{R}^+ \), all \( \omega \in \Omega \).

- \( U(0, x, \omega) = x \) for all \( x \in H \), \( \omega \in \Omega \).
The Cocycle Property

\[ U(t_1, \cdot, \omega) \quad U(t_2, \cdot, \theta(t_1, \omega)) \]

\[ \theta(t_1, \cdot) \quad \theta(t_2, \cdot) \]

\[ U(t_1, x, \omega) \quad U(t_1 + t_2, x, \omega) \]

\[ \begin{align*}
&U(t_1, \cdot, \omega) \\
\end{align*} \]
Theorem 1:

Under Hypotheses (B) and \((A_1)\), the Itô see (2) (or its Stratonovich version \((2')\)) admits a perfect jointly measurable \(C^1\) cocycle \((U, \theta)\) where

\[
U : \mathbb{R}^+ \times H \times \Omega \rightarrow H.
\]
Existence of the Cocycle

**Theorem 1:**

Under Hypotheses (B) and \((A_1)\), the Itô see (2) (or its Stratonovich version (2')) admits a perfect jointly measurable \(C^1\) cocycle \((U, \theta)\) where

\[
U : \mathbb{R}^+ \times H \times \Omega \rightarrow H.
\]

**Proof of Theorem 1:**

([M-Z-Z], Theorem 1.2.6).
Stationary Points

An $\mathcal{F}$-measurable random variable $Y : \Omega \rightarrow H$ is said be a **stationary point** for the cocycle $(U, \theta)$ if

$$U(t, Y(\omega), \omega) = Y(\theta(t, \omega))$$

for all $(t, \omega) \in \mathbb{R}^+ \times \Omega$. 
Stationary Points

An $\mathcal{F}$-measurable random variable $Y : \Omega \rightarrow H$ is said be a stationary point for the cocycle $(U, \theta)$ if

$$U(t, Y(\omega), \omega) = Y(\theta(t, \omega))$$

for all $(t, \omega) \in \mathbb{R}^+ \times \Omega$.

A stationary point of the see (2) corresponds to a stationary solution to the anticipating Stratonovich see (1).
Malliavin Regularity

For any integer $p \geq 2$, denote by $\mathbb{D}^{1,p}(\Omega, H)$ the Sobolev space of all $\mathcal{F}$-measurable random variables $Y : \Omega \rightarrow H$ which are $p$-integrable together with their Malliavin derivatives $\mathcal{D}Y$ ([Nu.1-2]).
For any integer $p \geq 2$, denote by $\mathbb{D}^{1,p}(\Omega, H)$ the Sobolev space of all $\mathcal{F}$-measurable random variables $Y : \Omega \rightarrow H$ which are $p$-integrable together with their Malliavin derivatives $\mathcal{D}Y$ ([Nu.1-2]).

We now state the main substitution theorem in this talk.
Theorem 2: (The Substitution Theorem)

Assume Hypotheses (B) and (A₁). Let $U : \mathbb{R}^+ \times H \times \Omega \to H$ be the $C^1$ cocycle generated by the see (2). Let $Y \in \mathbb{D}^{1,4}(\Omega, H)$ be a random variable. Then $v(t) := U(t, Y)$, $t \geq 0$, is a mild solution of the (anticipating) Stratonovich see
**Theorem 2:** (The Substitution Theorem)

Assume Hypotheses (B) and \((A_1)\). Let \(U : \mathbb{R}^+ \times H \times \Omega \to H\) be the \(C^1\) cocycle generated by the see (2). Let \(Y \in \mathbb{D}^{1,4}(\Omega, H)\) be a random variable. Then \(v(t) := U(t, Y), \ t \geq 0,\) is a mild solution of the (anticipating) Stratonovich see

\[
\begin{aligned}
dv(t) &= -Av(t) \, dt + F_0(v(t)) \, dt \\
&\quad + Bv(t) \circ dW(t), \ t > 0,
\end{aligned}
\]

\(v(0) = Y.\)
In particular, if $Y \in D^{1,4}(\Omega, H)$ is a stationary point of the see (2) (or (2')), then $U(t, Y) = Y(\theta(t))$, $t \geq 0$, is a stationary solution of the (anticipating) Stratonovich see (1):
In particular, if \( Y \in \mathbb{D}^{1,4}(\Omega, H) \) is a stationary point of the see (2) (or (2')), then \( U(t, Y) = Y(\theta(t)), \; t \geq 0 \), is a stationary solution of the (anticipating) Stratonovich see (1):

\[
dY(\theta(t)) = -AY(\theta(t)) \, dt + F_0(Y(\theta(t))) \, dt \\
+ BY(\theta(t)) \circ dW(t), \; t > 0
\]

\( Y(\theta(0)) = Y. \)
Furthermore, assume that $F_0$ is $C^2_b$. Then the linearized cocycle $DU(t,Y)$ is a mild solution of the linearized anticipating see
Furthermore, assume that $F_0$ is $C^2_b$. Then the linearized cocycle $DU(t,Y)$ is a mild solution of the linearized anticipating see

\[
\begin{align*}
    dDU(t,Y) &= -ADU(t,Y)\,dt \\
    &\quad + DF_0(U(t,Y))\,DU(t,Y)\,dt \\
    &\quad + \left\{ B \circ DU(t,Y) \right\} \circ dW(t), \quad t > 0,
\end{align*}
\]

$DU(0,Y) = \text{id}_{L(H)}.$

(5)
Outline of Proof

- Construct a linear cocycle for the linear Itô see (with $F \equiv 0$):
Outline of Proof

- Construct a linear cocycle for the linear Itô see (with $F \equiv 0$):

- Rewrite each finite-dimensional anticipating Stratonovich integral in terms of a Skorohod integral plus a Lebesgue integral correction term.
Outline of Proof-Contd

- Prove the substitution theorem when $Y$ is replaced by its finite-dimensional projections $Y_n$: Use finite-dimensional projections to smooth out the semigroup $T_t$ in $t$, and apply finite-dimensional substitution techniques.

- Rewrite each finite-dimensional anticipating Stratonovich integral in terms of a Skorohod integral plus a Lebesgue integral correction term.

- Let $n \to \infty$ using dominated convergence and the moment estimates on the cocycle, its Fréchet and Malliavin derivatives.
Existence of semiflows for mild solutions of linear see:

\[ du(t, x, \cdot) = -Au(t, x, \cdot) \, dt + Bu(t, x, \cdot) \, dW(t), \quad t > 0 \]

\[ u(0, x, \omega) = x \in H. \]
Linear SEE

Existence of semiflows for mild solutions of linear see:

\[ du(t, x, \cdot) = -Au(t, x, \cdot) \, dt \]
\[ + Bu(t, x, \cdot) \, dW(t), \quad t > 0 \]
\[ u(0, x, \omega) = x \in H. \]

\[ A : D(A) \subset H \rightarrow H \] closed linear operator on a separable real Hilbert space \( H \).
Existence of semiflows for mild solutions of linear see:

\begin{align*}
    du(t, x, \cdot) &= -Au(t, x, \cdot) \, dt \\
    &\quad + Bu(t, x, \cdot) \, dW(t), \quad t > 0 \\
    u(0, x, \omega) &= x \in H.
\end{align*}

\( A : D(A) \subset H \to H \) closed linear operator on a separable real Hilbert space \( H \).

e.g. \( A = -\Delta \) on compact smooth Riemannian manifold.
Mild Solutions: Linear Case

A *mild solution* of the linear see is a family of jointly measurable, \((\mathcal{F}_t)_{t \geq 0}\)-adapted processes

\[ u(\cdot, x, \cdot) : \mathbb{R}^+ \times \Omega \rightarrow H, \ x \in H \]

such that

\[ u(t, x, \cdot) = T_t x + \int_0^t T_{t-s} B u(s, x, \cdot) \, dW(s), \quad t \geq 0. \]

Integral equation holds \(x\)-almost surely, \(x \in H\).
A mild solution of the linear see is a family of jointly measurable, \((\mathcal{F}_t)_{t \geq 0}\)-adapted processes

\[
u(\cdot, x, \cdot) : \mathbb{R}^+ \times \Omega \to H, \quad x \in H
\]
such that

\[
u(t, x, \cdot) = T_t x + \int_0^t T_{t-s} B \nu(s, x, \cdot) \, dW(s), \quad t \geq 0.
\]

Integral equation holds \(x\)-almost surely, \(x \in H\).

Is \(\nu(t, x, \cdot)\) pathwise continuous linear in \(x\)?
Kolmogorov Fails!

\textit{Kolmogorov’s continuity theorem fails} for random field 
$I : L^2([0, 1], \mathbb{R}) \rightarrow L^2(\Omega, \mathbb{R})$

\[ I(x) := \int_{0}^{1} x(t) \, dW(t), \quad x \in L^2([0, 1], \mathbb{R}). \]
Kolmogorov’s continuity theorem fails for random field $I : L^2([0, 1], \mathbb{R}) \to L^2(\Omega, \mathbb{R})$

$$I(x) := \int_0^1 x(t) \, dW(t), \quad x \in L^2([0, 1], \mathbb{R}).$$

No continuous (or even measurable linear!) selection

$$L^2([0, 1], \mathbb{R}) \times \Omega \to \mathbb{R}$$

$$(x, \omega) \mapsto I(x, \omega)$$

of $I$ ([Mo.1], pp. 144-148).
Lifting

- Lift semigroup $T_t$, $t \geq 0$, to a strongly continuous semigroup of bounded linear operators

$$\tilde{T}_t : L_2(K, H) \rightarrow L_2(K, H), \ t \geq 0,$$

via composition

$$\tilde{T}_t(C) := T_t \circ C, \ C \in L_2(K, H), \ t \geq 0.$$
Lifting

- Lift semigroup $T_t, t \geq 0$, to a strongly continuous semigroup of bounded linear operators
  \[ \tilde{T}_t : L_2(K, H) \to L_2(K, H), t \geq 0, \text{ via composition} \]
  \[ \tilde{T}_t(C) := T_t \circ C, \ C \in L_2(K, H), t \geq 0. \]

- Lift stochastic integral

\[
\int_0^t \tilde{T}_{t-s}(\{ [B \circ v(s)](x) \}) \, dW(s), \ x \in H, t \geq 0,
\]

to $L_2(H)$ for adapted square-integrable

\[ v : \mathbb{R}^+ \times \Omega \to L_2(H). \text{ Denote lifting by} \]

\[
\int_0^t T_{t-s}Bv(s) \, dW(s) \in L_2(H).
\]
That is:

\[
\left[ \int_0^t T_{t-s} Bv(s) \, dW(s) \right](x) = \int_0^t \tilde{T}_{t-s} \left( \{ [B \circ v(s)](x) \} \right) \, dW(s)
\]

for all \( t \geq 0 \), \( x \)-a.s.
The Linear Flow

**Theorem 3:**
Assume hypothesis (B) and (A₁). Then the mild solution of the linear see has a Borel (strongly) measurable $(\mathcal{F}_t)_{t \geq 0}$-adapted version $\Phi : \mathbb{R}^+ \times \Omega \to L(H)$ with the following properties:
The Linear Flow

**Theorem 3:**
Assume hypothesis (B) and (A₁). Then the mild solution of the linear see has a Borel (strongly) measurable $(\mathcal{F}_t)_{t \geq 0}$-adapted version $\Phi : \mathbb{R}^+ \times \Omega \rightarrow L(H)$ with the following properties:

- $E \sup_{0 \leq t \leq a} \| \Phi(t, \cdot) \|_{L(H)}^{2p} < \infty$, whenever $p \geq 1$. 
The Linear Flow

**Theorem 3:** Assume hypothesis (B) and (A₁). Then the mild solution of the linear see has a Borel (strongly) measurable $(\mathcal{F}_t)_{t \geq 0}$-adapted version $\Phi : \mathbb{R}^+ \times \Omega \to L(H)$ with the following properties:

- $E \sup_{0 \leq t \leq a} \|\Phi(t, \cdot)\|_{L(H)}^{2p} < \infty$, whenever $p \geq 1$.

- $(\Phi, \theta)$ is a perfect $L(H)$-valued cocycle:

$$\Phi(t + s, \omega) = \Phi(t, \theta(s, \omega)) \circ \Phi(s, \omega)$$

for all $s, t \geq 0$ and all $\omega \in \Omega$;
The Linear Flow

**Theorem 3:**
Assume hypothesis (B) and (A₁). Then the mild solution of the linear see has a Borel (strongly) measurable $(F_t)_{t \geq 0}$-adapted version $\Phi : \mathbb{R}^+ \times \Omega \rightarrow L(H)$ with the following properties:

- $E \sup_{0 \leq t \leq a} \| \Phi(t, \cdot) \|_{L(H)}^{2p} < \infty$, whenever $p \geq 1$.

- $(\Phi, \theta)$ is a perfect $L(H)$-valued cocycle:

$$
\Phi(t + s, \omega) = \Phi(t, \theta(s, \omega)) \circ \Phi(s, \omega)
$$

for all $s, t \geq 0$ and all $\omega \in \Omega$;

- $\sup_{0 \leq s \leq t \leq a} \| \Phi(t - s, \theta(s, \omega)) \|_{L(H)} < \infty$, for all $\omega \in \Omega$. 

Anticipating Semilinear SPDEs  – p.37/72
For each $t > 0$ and almost all $\omega \in \Omega$, $\Phi(t, \omega) \in L_2(H)$ has “chaos-type” representation

$$\Phi(t, \cdot) = T_t + \sum_{n=1}^{\infty} \int_0^t T_{t-s_1} B \int_0^{s_1} T_{s_1-s_2} B \cdots \int_0^{s_{n-1}} T_{s_{n-1}-s_n} B T_{s_n} \, dW(s_n) \cdots dW(s_2) \, dW(s_1).$$

Iterated Itô stochastic integrals are lifted integrals in $L_2(H)$, and series converges absolutely in $L_2(H)$. 
Consider the semilinear Itô see:

\[
du(t) = -Au(t)dt + F(u(t))dt + Bu(t) \, dW(t), \quad t > 0,
\]

\[
u(0) = x \in H
\]  

(2)
Semilinear SEE

Consider the semilinear Itô see:

\[ du(t) = -Au(t)\,dt + F(u(t))\,dt + Bu(t)\,dW(t), \quad t > 0, \]
\[ u(0) = x \in H \]

Operators \( A, B \) satisfy hypothesis (B) and (\( A_1 \)).

\( F : H \to H \) is (Fréchet) \( C^1_b \), with linear growth:

\[ |F(v)| \leq C(1 + |v|), \quad v \in H \]

for some positive constant \( C \).
Recall a *mild solution* of semilinear Itô see (2) is a family of jointly measurable, \((\mathcal{F}_t)_{t \geq 0}\)-adapted processes \(u(\cdot, x, \cdot) : \mathbb{R}^+ \times \Omega \to H, \ x \in H\), satisfying:

\[
  u(t, x, \cdot) = T_t(x) + \int_0^t T_{t-s}(F(u(s, x, \cdot))) \, ds \\
  + \int_0^t T_{t-s}Bu(s, x, \cdot) \, dW(s),
\]

for all \(t \geq 0, \ x\text{-a.s.} \ (\text{[D–Z], Chapter 7, p. 182}).\)
Obtain a $C^k$ perfect cocycle $(U, \theta)$ for mild solutions of the semilinear see, via the random integral equation on $H$:

$$U(t, x, \omega) = \Phi(t, \omega)(x) + \int_0^t \Phi(t - s, \theta(s, \omega))(F(U(s, x, \omega))) \, ds$$

for each $\omega \in \Omega$, $t \geq 0$, $x \in H$. 
Estimates of the Cocycle

Get new global estimates on the non-linear cocycle $U : \mathbb{R}^+ \times H \times \Omega \rightarrow H$, its spatial Fréchet derivative $DU(t, x, \cdot)$ and its Malliavin derivatives $D_u U(t, x, \cdot)$ for $u, t \in [0, a]$ and $x \in H$. 

Derivations are based on results in [M.Z.Z], Gronwall’s lemma and the fact that $W$ has stationary independent increments.
Estimates of the Cocycle

Get new global estimates on the non-linear cocycle $U : \mathbb{R}^+ \times H \times \Omega \to H$, its spatial Fréchet derivative $D_U(t, x, \cdot)$ and its Malliavin derivatives $D_u U(t, x, \cdot)$ for $u, t \in [0, a]$ and $x \in H$.

Derivations are based on results in [M.Z.Z], Gronwall’s lemma and the fact that $W$ has stationary independent increments.
Theorem 4:

Assume Hypotheses (B), \((A_1)\) and let \(F\) be \(C^1_0\). Let \(U : \mathbb{R}^+ \times H \times \Omega \rightarrow H\) be the cocycle generated by the mild solutions of the see (2). Fix any \(a \in (0, \infty)\). Then:

\[
E \sup_{0 \leq t \leq a, \ x \in H} \frac{|U(t, x, \cdot)|^{2p}}{1 + |x|^{2p}_H} < \infty, \quad p \geq 1
\]

\[
E \sup_{0 \leq t \leq a, \ x \in H} \|DU(t, x, \cdot)\|^{2p} < \infty, \quad p \geq 1
\]

\(DU \ := \ Fréchet\ derivative\ of\ U\ in\ the\ spatial\ variable\ x.\)
More Estimates

Theorem 4':

In the see (2), assume Hypotheses (B) and \((A_1)\).
Theorem 4':

In the see (2), assume Hypotheses (B) and \((A_1)\).

(i) Let \(u, t \in [0, a]\). Define

\[
V(t, \cdot) := \Phi(t, \cdot) - T_t, \quad t \in [0, a].
\]

Then \(V(t, \cdot) \in D^{1,2p}(\Omega, L_2(H))\) and

\[
E \left[ \sup_{u \leq t \leq a} \left\| \mathcal{D}u V(t, \cdot) \right\|^2_{L_2(H)} \right] < \infty
\]

for all \(p \geq 1\).
(ii) Suppose $F$ is $C^1_b$. Then

$$E \left[ \sup_{0 \leq t \leq \alpha} \sup_{x \in H} \frac{|\mathcal{D}U(t, x, \cdot)|_{2p}^2}{(1 + |x|_{2p}^2)} \right] < \infty, $$

for all $p \geq 1$. $\mathcal{D} :=$ Malliavin derivative.
(ii) Suppose $F$ is $C^1_b$. Then

$$E \left[ \sup_{0 \leq t \leq a, x \in H} \frac{\left| \mathcal{D}U(t, x, \cdot) \right|^{2p}}{(1 + |x|^{2p})} \right] < \infty,$$

for all $p \geq 1$. $\mathcal{D} :=$ Malliavin derivative.

(iii) Let $F$ be $C^2_b$. Then

$$E \left[ \sup_{0 \leq u, t \leq a, x \in H} \frac{\| \mathcal{D}_u \mathcal{D}U(t, x, \cdot) \|^{2p}}{(1 + |x|^{2p})} \right] < \infty$$

for all $p \geq 1$. 
Finite-dimensional Projections

Objective:

To prove the substitution theorem when the random variable $Y \in \mathbb{D}^{1,4}(\Omega, H)$ is replaced by its finite-dimensional projections on $H$. 

$p$ – p.46/72
Finite-dimensional Projections

Objective:

To prove the substitution theorem when the random variable $Y \in \mathbb{D}^{1,4}(\Omega, H)$ is replaced by its finite-dimensional projections on $H$.

$\{e_n : n \geq 1\} :=$ complete orthonormal system of eigenvectors of $A$. 
Finite-dimensional Projections

**Objective:**

To prove the substitution theorem when the random variable $Y \in \mathbb{D}^{1,4}(\Omega, H)$ is replaced by its finite-dimensional projections on $H$.

\[ \{e_n : n \geq 1\} := \text{complete orthonormal system of eigenvectors of } A. \]

\[ H_n := L\{e_i : 1 \leq i \leq n\}, \text{ the } n\text{-dimensional linear subspace of } H \text{ spanned by } \{e_i : 1 \leq i \leq n\}, \text{ for each } n \geq 1. \]
Define the projections $P_n : H \to H_n$, $n \geq 1$, by

$$P_n(x) := \sum_{k=1}^{n} <x, e_k,> e_k, \quad x \in H.$$
Define the projections $P_n : H \rightarrow H_n$, $n \geq 1$, by

$$P_n(x) := \sum_{k=1}^{n} < x, e_k, > e_k, \quad x \in H.$$ 

Define $Y_n : \Omega \rightarrow H_n$ by

$$Y_n := P_n \circ Y, \quad n \geq 1.$$ 

Then $Y_n \rightarrow Y$ as $n \rightarrow \infty$ a.s.
Finite-dimensional Substitution

**Theorem 5:**

Assume (B) and (A₁) and suppose $Y \in D^{1,4}(\Omega, H)$. Then

$$dU(t, Y_n) = -AU(t, Y_n) \, dt + F_0(U(t, Y_n)) \, dt + BU(t, Y_n) \circ dW(t), \quad t > 0,$$

for each $n \geq 1$. 

$$U(0, Y_n) = Y_n.$$
Proof of Theorem 5

- Proof still requires Malliavin calculus techniques, largely due to the underlying strongly continuous semi-group dynamics in $\{T_t\}_{t \geq 0}$.

- Use global estimates on $U$ to represent the Stratonovich integrals in terms of Skorohod integrals.
- Project the semigroup $fT_t g$ onto $H_m$ and use finite-dimensional substitutions.
- Then pass to the limit as $m \to 1$ using global estimates on $U$ and dominated convergence.
Proof of Theorem 5

- Use global estimates on $U$ to represent the Stratonovich integrals in terms of Skorohod integrals.
Proof of Theorem 5

- Proof still requires Malliavin calculus techniques, largely due to the underlying strongly continuous semi-group dynamics in \( \{T_t\}_{t \geq 0} \).
- Use global estimates on \( U \) to represent the Stratonovich integrals in terms of Skorohod integrals.
- Project the semigroup \( \{T_t\}_{t \geq 0} \) onto \( H_m \) and use finite-dimensional substitutions.
Proof of Theorem 5

- Proof still requires Malliavin calculus techniques, largely due to the underlying strongly continuous semi-group dynamics in $\{T_t\}_{t \geq 0}$.

- Use global estimates on $U$ to represent the Stratonovich integrals in terms of Skorohod integrals.

- Project the semigroup $\{T_t\}_{t \geq 0}$ onto $H_m$ and use finite-dimensional substitutions.

- Then pass to the limit as $m \to \infty$ using global estimates on $U$ and dominated convergence.
Step 1:

Suppose \( Y \in \mathbb{D}^{1,4}(\Omega, H) \), and assume Hypothesis (B) and \((A_1)\).

Sufficient to show

\[
U(t, Y) = T_t(Y) + \int_0^t T_{t-s} F_0(U(s, Y)) \, ds \nonumber
\]
\[
+ \int_0^t T_{t-s} B U(s, Y) \circ dW(s). \nonumber
\]

(10)
Proof of Theorem 2-contd

**Step 2:**
Pass to the limit as $n \to \infty$ in the finite-dimensional result:

$$U(t, Y_n) = T_t(Y_n) + \int_0^t T_{t-s}F_0(U(s, Y_n)) \, ds$$

$$+ \int_0^t T_{t-s}BU(s, Y_n) \circ dW(s),$$

$$t > 0, \ n \geq 1.$$
Denote by $\mathbb{L}^{1,2}$ the class of all processes $v : [0, t] \times \Omega \rightarrow H$ such that $v \in L^2([0, t] \times \Omega, H)$, $v(s, \cdot) \in \mathcal{D}^{1,2}(\Omega, H)$ for almost all $s \in [0, t]$ and

$$E\left[\int_0^t \int_0^t \|\mathcal{D}_u v(s, \cdot)\|^2_H \, du \, ds\right] < \infty.$$
Denote by $\mathbb{L}^{1,2}$ the class of all processes $v : [0, t] \times \Omega \rightarrow H$ such that $v \in L^2([0, t] \times \Omega, H)$, $v(s, \cdot) \in \mathbb{D}^{1,2}(\Omega, H)$ for almost all $s \in [0, t]$ and

$$E\left[\int_0^t \int_0^t \|D_u v(s, \cdot)\|_H^2 \, du \, ds\right] < \infty.$$  

We say that $v$ belongs to $\mathbb{L}_{loc}^{1,2}$ if there exists a sequence $(\Omega_m, v^m) \in \mathcal{F} \times \mathbb{L}^{1,2}$ with the following properties:
Localization

Denote by $\mathbb{L}^{1,2}$ the class of all processes $v : [0, t] \times \Omega \rightarrow H$ such that $v \in L^2([0, t] \times \Omega, H)$, $v(s, \cdot) \in D^{1,2}(\Omega, H)$ for almost all $s \in [0, t]$ and
$$E[\int_0^t \int_0^t \|D_u v(s, \cdot)\|^2_H du ds] < \infty.$$ We say that $v$ belongs to $\mathbb{L}^{1,2}_{loc}$ if there exists a sequence $(\Omega_m, v^m) \in \mathcal{F} \times \mathbb{L}^{1,2}$ with the following properties:

(i) $\Omega_m \uparrow \Omega$ as $m \rightarrow \infty,$
Localization

Denote by $\mathbb{L}^{1,2}$ the class of all processes $v : [0, t] \times \Omega \rightarrow H$ such that $v \in L^2([0, t] \times \Omega, H)$, $v(s, \cdot) \in \mathbb{D}^{1,2}(\Omega, H)$ for almost all $s \in [0, t]$ and $E[\int_0^t \int_0^t \|D_u v(s, \cdot)\|^2_H \, du \, ds] < \infty$.

We say that $v$ belongs to $\mathbb{L}^{1,2}_{loc}$ if there exists a sequence $(\Omega_m, v^m) \in \mathcal{F} \times \mathbb{L}^{1,2}$ with the following properties:

(i) $\Omega_m \uparrow \Omega$ as $m \rightarrow \infty$,

(ii) $v = v^m$ on $\Omega_m$. 
Proof of Theorem 2

Step 3:

The Stratonovich integral

\[ \int_0^t T_{t-s} BU(s, Y) \circ dW(s) \]

in (10) is well-defined:
Proof of Theorem 2

Step 3:

The Stratonovich integral

$$\int_0^T T_{t-s} BU(s, Y) \circ dW(s)$$

in (10) is well-defined:
Sufficient to show that the process

$$v(s) := T_{t-s} BU(s, Y), s \leq t$$

is in $L^{1,2}_{loc}$: Localize $v$ using a bump function $\phi_m \in C^2_b(\mathbb{R}, \mathbb{R})$ such that $\phi_m(z) = 1$ for $|z| \leq m$ and $\phi_m(z) = 0$ for $|z| > m + 1$. ([Nu.2], Theorem 5.2.3).
Step 4:

Pass to the limit a.s. as $n \to \infty$ in (7). Get easy a.s. limits:

\[
\lim_{n \to \infty} U(t, Y_n) = U(t, Y)
\]

\[
\lim_{n \to \infty} T_t(Y_n) = T_t(Y)
\]

\[
\lim_{n \to \infty} \int_0^t T_{t-s} F_0(U(s, Y_n)) \, ds = \int_0^t T_{t-s} F_0(U(s, Y)) \, ds
\]
Step 5:

But following limit is non-trivial:

$$\lim_{n \to 1} Z_t = \int_0^T \int_B U_s(Y_n) \, dW_s$$

in probability.
A Not-So-Easy Limit

**Step 5:**

But following limit is non-trivial:

\[
\lim_{n \to \infty} \int_0^t T_{t-s} BU(s, Y_n) \circ dW(s) = \int_0^t T_{t-s} BU(s, Y) \circ dW(s)
\]

in probability.
Proof of Theorem 2-contd

Step 6:

To prove (11), use localization:

$$Z_t^0 T t_s B_u(s; Y_n) dW(s) = Z_t^0 T t_s B_u(s; Y_n) m(j Y j H) dW(s);$$
on

$$m := f ! j Y j H g;$$
Proof of Theorem 2-contd

Step 6:

To prove (11), use localization:
Proof of Theorem 2-contd

Step 6:

To prove (11), use localization:

\[
\int_0^t T_{t-s}BU(s,Y_n) \circ dW(s) = \int_0^t T_{t-s}BU(s,Y_n)\phi_m(|Y|_H) \circ dW(s),
\]

on \( \Omega_m := \{ \omega : |Y(\omega)|_H \leq m \} \);
Proof of Theorem 2-contd

and

\[
\int_0^t T_{t-s} BU(s,Y) \circ dW(s)
\]

\[= \int_0^t T_{t-s} BU(s,Y) \phi_m(|Y|_H) \circ dW(s)
\]

on \(\Omega_m\) for any fixed integer \(m \geq 1\).
Proof of Theorem 2-contd

Step 7:

(11) will follow from

\[
\lim_{n \to \infty} \int_0^t T_{t-s} BU(s, Y_n) \phi_m(\|Y\|_H) \circ dW(s)
\]

\[
= \int_0^t T_{t-s} BU(s, Y) \phi_m(\|Y\|_H) \circ dW(s)
\]

in probability for each \( m \geq 1 \).

(12)
Proof of Theorem 2-contd

To prove (12), fix $m \geq 1$ and let

$$g_n(s) := T_{t-s}BU(s, Y_n)\phi_m(||Y||_H),$$

$$g(s) := T_{t-s}BU(s, Y)\phi_m(||Y||_H)$$

for all $s \in [0, t]$. Then

$$\lim_{n \to \infty} E \left[ \int_0^T \|g_n(s) - g(s)\|_{L_2(K,H)}^2 ds \right] = 0 \quad (13)$$

$$\lim_{n \to \infty} E \left[ \int_0^T \int_0^T \|\mathcal{D}_u g_n(s) - \mathcal{D}_u g(s)\|_{L_2(K,H)}^2 du ds \right] = 0. \quad (14)$$
Proof of Theorem 2-contd

Compute:

\[(\mathcal{D}_+ g)_u := \lim_{s \to u^+} \mathcal{D}_u g(s)\]

\[(\mathcal{D}_- g)_u := \lim_{s \to u^-} \mathcal{D}_u g(s)\]

\[(\nabla g)_u := (\mathcal{D}_+ g)_u + (\mathcal{D}_- g)_u\]
Proof of Theorem 2-contd

Compute:

\[(\mathcal{D} + g)_u := \lim_{s \to u^+} \mathcal{D}_u g(s)\]

\[(\mathcal{D} - g)_u := \lim_{s \to u^-} \mathcal{D}_u g(s)\]

\[(\nabla g)_u := (\mathcal{D} + g)_u + (\mathcal{D} - g)_u\]

and use path continuity to get

\[\lim_{n \to \infty} (\nabla g_n)_u = (\nabla g)_u, \quad a.s.\]
Proof of Theorem 2-contd

**Step 8:**

Proof of substitution theorem will be complete if:

\[
\int_0^t g_n(s) \circ dW(s) = \int_0^t g_n(s) dW(s) + \frac{1}{2} \int_0^t (\nabla g_n)_s ds,
\]

for \( n \geq 1 \); and

\[
\int_0^t g_n(s) \circ dW(s) = \int_0^t g_n(s) dW(s) + \frac{1}{2} \int_0^t (\nabla g_n)_s ds,
\]

\( \text{for } n \geq 1; \) and
Proof of Theorem 2-contd

**Step 8:**
Proof of substitution theorem will be complete if:

\[
\int_0^t g_n(s) \circ dW(s) = \int_0^t g_n(s) dW(s) + \frac{1}{2} \int_0^t (\nabla g_n)_s ds, \tag{15}
\]

for \( n \geq 1 \); and

\[
\int_0^t g(s) \circ dW(s) = \int_0^t g(s) dW(s) + \frac{1}{2} \int_0^t (\nabla g)_s ds \tag{16}
\]
a.s. Skorohod integrals on RHS.
Proof of Theorem 2-contd

Prove (15) and (16) from first principles, using approximations by Riemann sums: **Lengthy computation.**
Proof of Theorem 2-contd

Prove (15) and (16) from first principles, using approximations by Riemann sums: **Lengthy computation.**

**Step 9:**

Take \( n \to \infty \) in RHS of (15) and get:

\[
\lim_{n \to \infty} \int_0^t T_{t-s} BU(s, Y_n) \phi_m(|Y|_H) \circ dW(s)
\]

\[
= \int_0^t T_{t-s} BU(s, Y) \phi_m(|Y|_H) \circ dW(s)
\]

in probability for each \( m \geq 1 \).
