ABSTRACT

Prediction of Activity Spectra for Substances (PASS), a new computer program, has been generated to evaluate the biological activity of four major flavanoids from a medicinal herb, *Boesenbergia pandurata* Holtt. (Zingiberaceae). Principal anti-HIV and other biological activities of pinostrobin, pinocembrin, cardamonin and alpinetin were predicted through PASS, their similarity and difference in the mechanisms of action with reference to accessory biological activities have been compared (Tables 1-4) and verified with the available data (<http://195.178.207.233/PASS/socket1.php>) on pharmacological and toxicological activity of these compounds.

KEY WORDS: Anti-HIV Drugs, Flavanoids, *Boesenbergia pandurata*, Pinostrobin, Pinocembrin, Cardamonin, Alpinetin.

INTRODUCTION

Acquired immunodeficiency syndrome (AIDS) has evolved rapidly into an epidemic and world-wide health crisis. The number of people infected with HIV rose to just over 40 million in 2006, an increase of over 2 million since 2004 (WHO/UNAIDS (2006). More than 60% of infected people live in sub-Saharan Africa, where at least 2 million deaths from HIV/AIDS occurred in 2006. Novel therapeutic strategies are urgently needed for deployment alongside conventional antiretroviral drugs, vaccines, and microbicides to prevent the spread of the disease.

Many attempts have been carried out to discover compounds as anti-HIV-1 agents and enzyme inhibitors of the HIV-1. However, the effective agents for treatment of this disease are still in demand since HIV-1 is resistant to some synthetic anti-HIV-1 PR inhibitors (Borman *et al.*, 1996). HIV-1 PR hydrolyzes viral polyproteins into functional enzymes and structural proteins that are essential for viral assembly (Kohl *et al.*, 1988). Therefore, HIV-1 PR is considered to be an important target for development of anti-HIV-1 drugs.

A number plants have exhibited a potent anti HIV-1 effect and their valid utilization for the formulation of such drugs have been reported during recent past and several active plant based secondary metabolites have been recognized. Most of them able to act specifically on enzymatic targets. Different parts of twelve Thai medicinal plants - *Zingiber zerumbet* (rhizome), *Boesenbergia pandurata* (rhizome), *Piper chaba* (fruit), *Eclipta prostrata* (whole plant), *Barleria lupulina* (leaf, stem), *Acanthus ilicifolius* (leaf and stem), *Alpinia galangal* (rhizome), *Piper betel* (leaf), *Spilanthes acmella* (whole plant), and *Coccinia grandis* (leaf) have been reported to have a potent HIV-1 PR inhibitory activities (Tewtrakul *et al.*, 2003). Moreover, Tewtrakul *et al.*, (2003) reported that four major flavonoids (pinostrobin, pinocembrin, cardamonin and alpinetin) isolated from the ethanol extract of *Boesenbergia pandurata* (yellow rhizome) to show inhibitory activity against HIV-1 protease (HIV-PR).

Recently, Computer Aided Drug Design (CADD) is widely used in new drug R & D (Franke and Herrmann, 1994). Such a newly developed computerized system - PASS (Prediction of Activity Spectra for Substance) that estimates simultaneously the probability of more than 100 pharmacological activity, effects and mechanisms (Filimonov *et al.*, 1995, Filimonov and Poroikov (1996). Therefore, the present study was designed towards the Prediction of Activity Spectra for four flavoniod constituents viz; pinostrobin, pinocembrin, cardamonin and alpinetin. A specific server has been generated which predicts the possibility of a drug to be active against a target based on the physico-chemical methods using comparisons and several algorithms. It is observed that the approach, used in PASS, may be applied to other biological activities (Filimonov *et al.*, 1995; Filimonov *et al.*, 1996).

MATERIALS AND METHODS

PASS 4.20 prediction search includes 9314 biologically active substances. PASS 4.20 predicts the probabilities of presence/absence for 114 biological actions simultaneously (main and side pharmacological effects, mechanisms, specific toxicity). The biological activity spectrum of PASS was designed and prediction was made with the comparison from the source data available in <http://195.178.207.233/PASS/predict.php>. Biological activity spectrum of a compound presents exhibit its activity despite the difference in essential conditions of its experimental determination.

RESULTS AND DISCUSSION

Four flavonoids constituents like pinostrobin, pinocembrin, cardamonin and alpinetin were predicted. PASS predicted search results shows that the available information on the pharmacological and toxicological activity of these compounds and are corroborative with the previous reports (Tewtrakul *et al.*, 2003). The results showed that pinocembrin could possess several biological activities including anti-HIV(throughtheserver) <http://195.178.207.233/PASS/socket1.php>, (Table-1). More interestingly, this compound showed antineoplastic, antiseborrheic, and activity against membrane permeability inhibitor. Next active constituent of the plant extract i.e., alpinetin was predicted with such a similar multitude activity through the same server - <http://195.178.207.233/PASS/socket1.php> (Table.2). Pinostrobin was predicted with numerous biological activities principally with anti-HIV (Table.3) and other accessory activities like membrane integrity agonist, phosphatase inhibitor, free radical scavenger, apoptosis agonist, cell adhesion inhibitor, testosterone 17beta-dehydrogenase inhibitor and antineurotoxic activity (<http://195.178.207.233/PASS/socket1.php>). The extended PASS prediction strategy was revealed with an interesting data yield regarding the biological activities of cardamonin like antiseborrheic and arminative, etc., (Table.4) other than the anti-HIV effects (<http://195.178.207.233/PASS/socket1.php>). After having a biological activity prediction, a comparative analysis was made regarding the individual mechanism of action of these four active flavonoids of this plant extract. Controversially, four active flavonoids have shown much variability despite their similarity in their inhibitory activities (Tables 1-4). This difference may be due to the diversity among the target sites and the reciprocal activity of the specific drug towards such diversified targets and their differential physiological conditions too.

CONCLUSION

All the four flavonoids observed to have a multi potentials as hepatoprotectant, antipruritic, allergic, anti inflammatory, neuroprotector other than their principal anti-HIV activity.

While planning experiments and choosing the activities on which the compound has to be tested, it is necessary to keep in mind the balance between the novelty of pharmacological action and the risk to obtain negative result in experimental testing. Certainly, in this present study, such a vital approach has been made to take into account the particular interest in some kinds of activities other than the principal anti- HIV activity of the four flavonoids from this plant extract. The accuracy of biological activity prediction through PASS with reference to four flavonoid constituents is about 90%. Moreover, a thorough study regarding the legend, mode of action of the drugs with reference to the specific targets, their differential physiological conditions need to be mooted up to arrive with a final design of life saving drugs of this kind.

ACKNOWLEDGEMENT

Authors are thankful to the Principal, St. Xavier's College, Palayamkottai for providing basic laboratory facilities.

Table-4:Biological Activity Spectrum Of Anti HIV constituent - Cardamonin

28 Substructure descriptors; 0 new. 7 Possible activities at Pa > 70% Pa Pi for Activity:

0,899 0,014 Mucomembranous protector

0,878 0,001 Sodium/bile acid cotransporter inhibitor

0,884 0,021 Membrane integrity agonist

0,769 0,008 2,6-Dihydroxypyridine 3-monooxygenase inhibitor

0,763 0,030 CC chemokine 2 receptor antagonist

0,789 0,083 Antiseborrheic

0,703 0,015 Carminative

EFFECTS

0,884 0,021 Antiviral
