Abstract

Morinda Citrifolia is one of the most important traditional Polynesian medicinal plants. This small evergreen tree is native from South Eastern Asia to Australia and now it has a Pantropical distribution. It has antifungal, antibacterial, antiinflammatory and antiviral activities. Morinda citrifolia L. was studied for its antimicrobial activity. The leaves of this plant were dried, powdered and different extracts were prepared using different solvents like benzene, chloroform, ethyl acetate, ethanol and water. Four organisms, namely E.coli, Staphylococcus aureus, Candida albicans and Aspergillus niger, were used for investigation. The activity of each solvent extract was checked on each organism by disc diffusion method and then the zone size of each was measured. The results of our antimicrobial assay revealed that plant extracts showed inhibitory activity against the tested organisms.

Key words: Antimicrobial activity, Morinda citrifolia, Petroleumether extract and inhibitory activity.

Introduction

Morinda citrifolia is an important medicinal plant which has been used for many centuries through out the south pacific. It is a small shrub, three to twelve meters height (Wang, Su 2001). The leaves, seeds, bark, green fruit and roots have been used in various tropical remedies in diverse parts of the South East Asia and Pacific Islands. Most pacific islands medicinal plants have yet to be studied due to geographical isolation from the western world. Their potential therapeutic properties are still unknown (Mc Clatchy 2002). M.citrifolia is commonly known in various cultures as Indian Mulberry, Ba Ji Tian, Nono, Nonu (or) Noni, Cheese fruit and Nhau (Wang et al 2002).

Noni contains a great variety of active constituents including 3,3’ – bisdemethylpinoresinol, americanol A, americanin A, americanoic acid A, morindolin, and isoprincepin. The fruit also contains various anthaquinones including damnacanthal (Gurib-Fakielm and Brendler, 2004 ; Kamiya et al., 2004 ; Shotripuk et al., 2004; Stalman et al., 2003 ). The leaves are used to treat cough, nausea and colic, possibly due to its anti inflammatory activity (Gurib-Fakim and Brendler, 2004). The leaves have also been used to treat gout, tuberculosis and ring worm. In the Philippines, the seeds are eaten in order to expel intestinal worms. This plant has also been popular as a source of red, yellow and purple dyes (Gurib-Fakim and Brendler, 2004).

Morinda is reputed to have antibacterial, antiviral, antifungal, antitumor, antihelminthic, analgesic, hypotensive, anti-inflammatory, and immune enhancing effects. (Duke et al., 2002; McClatchey, 2002 ; Wang et.al., 2002; Liu et al., 2001 ; Wang and Su, 2001). Originally, the leaves were applied directly to the
skin to treat ulcerations and minor infections. Some marketing companies have proposed that drinking noni juice can be used against a very wide variety of ailments. Scientific information about the therapeutic effects of noni on humans is currently limited. The present investigation has been carried out to evaluate the antimicrobial activity of *M. citrifolia* leaf extracts.

**Materials & Methods**

**Plant collection:**
Leaves were collected from Malappuram. The Taxonomic identities of plants were confirmed by Dr. Gopalan, Retd Scientist, Botanical Survey of India, TNAU Campus for the Botanical verification and authenticating the plant material. Fresh plant materials were shade dried and homogenized to a fine powder.

**Plant extraction**
The powdered medicinal plant material was taken and subjected to successive solvent extraction in the increasing order of polarity i.e. from non polar to high polar. The solvents used are Petroleum ether, Benzene, Chloroform, Ehtyl acetate, Ethanol and water.

For above solvent extraction 50g of powdered plant material of *Morindacitrifolia* was mixed with 250 ml of Petroleum ether and subjected to occasional shaking for 24 hrs. The extracts were filtered through Muslin cloth. And extracts concentrated by evaporation at room temperature until the solvent gets evaporated completely. After complete drying the above said residues were extracted with all the other solvents separately. Then extracted materials lyophilized by occasional shaking for 24 hrs.

**Bacterial Strains**
Bacterial Strains used in this study were purchased from MTCC. *E.coli, S. aureus, Candida albicans, Aspergillus niger*. All the strains were confirmed by cultural & biochemical characteristics and maintained in slants for further use.

**Antimicrobial Activity**
Antimicrobial assay of solvent extracts were performed by Disc diffusion method. (Bauer et al 1966). Lawn culture of *E.coli, S. aureus, Candida albicans and Aspergillus niger* were developed on Muller hinton and SDA respectively using sterile cotton swabs. The sterile disc 6mm was saturated at concentrate of 10mg/ml, 5mg/ml and 2 mg/ml. Disc with Dimethyl Sulphoxide is used as control and the respective antibiotic disc Gentamycin and Nystatin used as positive control. The sterile impregnated disc with plant extract were placed on the agar surface with flamed forceps and gently pressed down to ensure complete contact of the disc with the agar surface. After the incubation the size of the inhibition zone were measured. Antibacterial and antifungal activity was determined by measuring the diameter of the zone of inhibition surrounding microbial growth. For each strain, controls were included that comprised pure solvents instead of the extract (Parekh and Chanda 2007). The experiments were repeated three times and the mean values were presented.

**Results**
The antimicrobial activity in terms of zone of inhibition was presented in Table 1 and Table 2. The invitro antibacterial and antifungal activity of petroleum ether, chloroform and benzene extract of *Morinda citrifolia* leaf showed in Table.1. Ethyl acetate, Ethanol and water extracts activity showed in Table 2. The results obtained from the disc diffusion assay showed that there has been an increasing effect on microbial growth inhibition with increasing concentration of the extract. The extract showed good inhibitory activity on almost all the microbes tested.

The maximum inhibition was recorded against *E. coli* with the extract of petroleum ether in 20mm. The gram positive *S.aureus* was susceptible with the inhibition zone ranging from 18mm in water extract. The
maximum inhibition was observed against *C. albicans* with the chloroform extract. The water extract showed significant effect against *A. niger*. The observed activity may be due to the presence of potent phytoconstituents in the leaf extract. This may be indicative of a significant potential for isolating purer compounds.

**Discussion and Conclusion**

Antimicrobial activity of *Morinda citrifolia* leaf extract is compared with the antibiotics’ of the respective organism. It was found that the extract in some cases exhibited the zone of inhibition which was equal or greater than the zone of inhibition of antibiotic (Rios and Recio., 2005). As a result it is sure that these leaf extract can surely inhibit the growth of these microorganisms there by preventing various disease such as skin infections, diabetes, cancer etc. *Morinda citrifolia* leaf extract thus provides safe, easy, effective and practical solutions to every day ailments leaving behind no toxins and creating a clean, pleasant atmosphere. The overall results indicate promising baseline information for the potential uses of solvent extracts of *M. citrifolia* leaf in the treatment of infectious disease.
