Issued 15 December 2008

Abstract
Eleven locally used medicinal plants were selected for an intensive in-depth literature review, the purpose of which was to learn more of their therapeutic activity, local effects and chemical constituents.

Key words: Medicinal plants, Traditional Use, Major Constituents.

Introduction
Plants are the natural reservoir of many antimicrobial, anticancer agents, analgesics, anti-diarrheal as well as various therapeutic activities. Bangladeshi people have traditional medical practice as an integral part of their culture. A lot of medicinal plants are available for the treatment of various diseases. However, scientific studies have been conducted on only a relatively few medicinal plants, and then only to a superficial extent. In this investigation, 11 locally used plants were selected for an intensive in-depth literature review, the purpose of which was to learn more of their therapeutic activity, local effects and chemical constituents.

Materials and Methods
A field survey was done during the months of June and July in the Khulna district of Bangladesh and a list of various medicinal plants and their local uses was compiled. A literature review was then initiated in order to learn more of their therapeutic activity and chemical constituents in various journals, books and the Internet. This study provides some fundamental information for researchers.

Result and Discussion
Table 1. Local use and their therapeutic activity and chemical constituents of some medicinal plants of Bangladesh.
